

Introducing NightWatch - An Innovative Solution for Parents of Children with Rett Syndrome.

I am writing to you on behalf of NightWatch, an advanced monitoring system specifically designed to provide parents with peace of mind when caring for children with nocturnal epileptic seizures. We understand that caring for your child with Rett syndrome can be challenging, especially as nocturnal monitoring is often essential.

As you probably know, children with Rett syndrome can also have epileptic seizures at night. And this is when a seizure can be fatal. The nights, therefore, cause parents a lot of worry, stress and sleeplessness. NightWatch can take away many of these worries. This unique armband signals an alarm if a child has a possible seizure. It is a wonderful solution that can give peace of mind and confidence.

NightWatch is designed to help you ensure your child's safety and well-being, especially at night, when monitoring can be most challenging. The system uses advanced technology to detect unusual movements or changes in heart rate that may occur during an epileptic seizure. This allows you to react quickly and take necessary action when needed.

Some features of NightWatch include:

- **Continuous Monitoring:** NightWatch monitors your child's movement and heart rate and alerts you if anything unusual is detected.
- **Nighttime Convenience:** You can sleep peacefully knowing that NightWatch is watching over your child while he or she sleeps.
- **User-friendliness:** NightWatch is easy to install and use.

We understand that caring for a child with Rett syndrome can be intense, and we hope NightWatch can provide you with extra peace of mind. The NightWatch team is ready to support you and answer your questions about how NightWatch can be integrated into your family's care routine.
